

(a) VASP 6.5.1 — Na₃PS₄, 128 atoms, 25 SCF steps

(b) MACE-MPA-0 MD — 1,024 atoms

(c) MACE-MPA-0 MD — 3,456 atoms

● CPU node (all cores) ● GPU (1 card) ○ China HPC □ vanda △ fornax ◇ hopper —○— Pareto front (optimal nodes)

Points: median of 3 runs; whiskers: min-max. Cost = charged rate × resources × wall time, in SGD. China HPC and NUS (vanda, hopper) use their chargeback rates.

fornax is the group's own server and is priced at public-cloud on-demand rates for equivalent hardware (AWS c7a for the EPYC CPUs; median RTX 5090 rental) — see README, Cost model.
